1. Executive Summary

This report provides an overview of the Vulnerability Test Assessment conducted for Green Fossils' Church Management System, addressing the OWASP Top 10 security risks. The assessment aims to identify and evaluate vulnerabilities in the company's web application and infrastructure which enables informed decision-making to enhance the overall security posture.

Scanned by: admin

Ommitted Scans:
cookie_attribute_checking, unrestricted_file_upload, bruteforce, Forced_browsing, injection, sessionReplay, overinformative_error,

Each risk category was examined thoroughly and vulnerabilities were identified and classified based on their severity. The key findings and recommendations from the assessment are summarized below. The vulnerabilities identified in the Vulnerability Test Assessment Suite for Green Fossils' digital assets pose significant risks to the company's operations, reputation, and bottom line. Ignoring or delaying the remediation of these vulnerabilities can lead to a range of detrimental business impacts.

2. Scan Results

The raw scan results will be provided upon delivery.

3. Our Findings

The results from the credentialed patch audit are listed below.

4. Risk Assessment

This report identifies security risks that could have significant impact on mission-critical applications used for day-to-day business operations.

| | | |
|-------------------|-----------------|--------------|
| Critical Severity | Medium Severity | Low Severity |
| 0 | 0 | 0 |

High Severity Vulnerability

0 were unique high severity vulnerabilities. High severity vulnerabilities are often harder to exploit and may not provide the same access to affected systems.

| | | |
|----------|--------------------|------------|
| Severity | Vulnerability Type | Checked at |
|----------|--------------------|------------|

Medium Severity Vulnerability

0 were unique medium severity vulnerabilities. These vulnerabilities often provide information to attackers that may assist them in mounting subsequent attacks on your network. These should also be fixed in a timely

manner but are not as urgent as the other vulnerabilities.

| Vulnerability | Description | Solution |
|---------------|-------------|----------|
|---------------|-------------|----------|

Low Severity Vulnerability

0 were unique low severity vulnerabilities. These vulnerabilities are not as serious as other vulnerabilities but might be used by attackers in rare cases.

| Vulnerability | Description | Solution |
|---------------|-------------|----------|
|---------------|-------------|----------|

5. Recommendations

Recommendations in this report are based on the available findings from the credentialed patch audit. Vulnerability scanning is only one tool to assess the security posture of a network. The results should not be interpreted as definitive measurement of the security posture of the network. Other elements used to assess the current security posture would include policy review, a review of internal security controls and procedures, or internal red teaming/penetration testing.
